1 Data QC

1.1 Raw data processing summary

Bar plots of reads per sample at each step of the QC process. Raw reads were processed through the DADA2 pipeline. Missing metadata: POOLED-SG_S75_L001 POOLED-SHAM_S74_L001 removed.

1.2 Metadata group bias

Bar plots of final reads.

Bar plots of final reads colored by metadata grouping.

1.3 Summary of categorical metadata

2 Alpha diversity analysis

Alpha diversity metrics are performed on the normalized, unfiltered, species level taxonomic table.

2.1 Univariable ANOVA

ANOVA on linear model for each independent variable using the Inverse Simpson index.

	Sum Sq	Df	F value	Pr(>F)
TreatmentGroup	9.100	3	1.114	0.363
Residuals	65.351	24	NA	NA

Heatmap of FDR adjusted ANOVA p-values.

Box plots of categorical variable alpha diversity.

Tukey corrected least squares means pairwise comparisons for categorical variables.

3 Taxonomy visualization

3.1 Taxonomy visualized as stacked barplots

Abundances were passed through a basic filter requiring each species to have at least 0.01% abundance in at least 10% of all samples. A total of 97 species and 90 genera were identified. After basic filtering 60 species and 56 genera remained. The lowest taxonomic rank to be identified above species and genus respectively is displayed.

Bar plot of the top 20 species.

Bar plot of the top 20 genera.

3.1.1 Bar plots grouped by metadata

Bar plot of the top 20 species faceted by metadata category.

Bar plot of the top 20 species faceted by metadata category and averaged.

Bar plot of the top 20 genera faceted by metadata category.

Bar plot of the top 20 genera faceted by metadata and averaged.

3.2 Taxonomy visualized as heatmaps

3.2.1 Heatmaps clustered based on similar compositions

Heatmap of log₁₀ relative abundances of the species in samples. Samples (columns) and taxa (rows) are UP-GMA clustered based on Bray-Curtis dissimilarities and Euclidean distances, respectively. Missing metadata are colored gray. Top 20 most abundant species are displayed.

Top 20 most abundant genera are displayed.

3.2.2 Heatmaps sorted based on metadata

Heatmap of log₁₀ relative abundances of the species in samples. Samples (columns) and taxa (rows) are sorted by metadata and UPGMA clustered, respectively. Missing metadata are colored gray.

Top 20 most abundant genera are displayed.

4 Principle coordinates analysis

4.1 PCoA colored by metadata category

4.1.1 Bray-Curtis results

Species level plots.

Genus level plots.

4.1.2 Weighted UniFrac results

Species level plots.

Genus level plots.

4.1.3 Unweighted UniFrac results

Species level plots.

Genus level plots.

5 Beta diversity analysis

5.1 Univariable PERMANOVA

5.1.1 Bray-Curtis results

PERMANOVA on Bray-Curtis of Species level relative abundances with 999 permutations.
